

National Shrimp Day

Shrimp are crustaceans that can be found by the seafloor or in rivers and lakes. There are over 2,000 species of shrimps that usually live between 1 to 7 years. Shrimp are very nutritious and can range in sized from a few millimeters to more than 20 centimeters (or about 8 inches).

Shrimp can be a beneficial part of an aquarium ecosystem by cleaning up excess bits of food. Color the shrimp and the coral decorations below!
