

Design Your Own Weather

Clouds are made from evaporated water or ice. As the water rises, the temperature drops and the water condenses into tiny drops and the drops combine into clouds. When the water gets too heavy it falls as rain! If it's cold enough they condense into ice. They form when warm air rises into the cool air above it. The warm air cools down which causes the water in the air to form small droplets.

Using what you know about rain, design your own weather!
In your world, is rain made of water or something else?
What shape do your clouds form in? What color?
Draw it below based off of this diagram.

Fun Fact: Did you know there are 2,000 thunderstorms going on at any time?
