

How to make your own T-shirt at home

01

Choose a color

Look at your design. If you have a dark design, use a light-colored shirt. If you have a light-colored design, use a dark-colored shirt.

02

Choose products

When shopping, pay attention to the quality and type of fabric. There are certain fabrics such as cotton that designs stick better to.

03

Gather your supplies and prepare design

You will need an inkjet printer, iron-on transfer paper, iron, cotton pillowcase, scissor/craft knife, and a high-quality image of the design.

04

Print your design

For a light-colored shirt, mirror your design before printing. Do NOT mirror your design if you have a dark-colored shirt. Pop that transfer paper in, and print your design.

06

Cut out the design

After printing, give the ink a couple of minutes to dry. Any paper around the design will be visible on your shirt, so make sure to cut your design carefully and as precisely as possible.

05

Set up your printing station

Grab the iron, pillowcase, and shirt. Place your shirt above the pillowcase, and lay them on a flat surface. Set up the iron by following the instructions on the transfer paper. Next, iron the shirt.

08

Place your design and Iron

For light-colored shirts, place the design facing down. For dark-colored shirts, place the design facing up. Move around the design until you find a good placement. Now iron. Start at the center and move outwards using a circular motion.

09

Check the shirt

After letting the shirt cool for a couple of minutes, grab a corner and peel off the paper. If your design is stuck to the paper, iron again.
